

EXPERIMENT 29:

Demonstrate Infrastructure as a Service (IaaS) by establishing the remote connection, launch the created VM image and run in your desktop..

Aim

To develop a simple web application using **Python Flask** and deploy it on **Microsoft Azure App Service** to demonstrate the **Platform as a Service (PaaS)** cloud computing model.

Procedure

1. Create a simple web application using **Python Flask** with a basic home page.
2. Install the required Flask framework and create a requirements.txt file containing the required dependencies.
3. Test the web application locally to ensure that the application is functioning correctly.
4. Create an **Azure App Service** through the Azure Portal and configure the application using Python as the runtime stack and Linux as the operating system.
5. Deploy the Flask application to the Azure App Service using Visual Studio Code or another supported deployment method.
6. Configure the appropriate startup command for running the Flask application on Azure App Service.
7. After successful deployment, obtain the public URL provided by Azure App Service.
8. Open the URL in a web browser and verify that the web application is accessible over the Internet.
9. The deployment demonstrates **PaaS**, as Azure provides the application hosting platform, runtime environment, scaling and infrastructure management without requiring the user to manage the underlying server.

IMPLEMENTATION:

Welcome to Azure PaaS

Python Flask Web Application

This application is hosted on Microsoft Azure App Service.

Result:

Thus, a simple Python Flask web application was successfully developed and deployed using Microsoft Azure App Service. The application was made publicly accessible through an Azure-provided URL, successfully demonstrating the Platform as a Service (PaaS) model of cloud computing.
