

EXPERIMENT 28:

Demonstrate Infrastructure as a Service (IaaS) by establishing the remote connection, launch the created VM image and run in your desktop..

Aim

To demonstrate **Platform as a Service (PaaS)** using **Microsoft Azure** by creating and configuring a new application environment or VM image that can be used to deploy and run applications without managing the underlying physical infrastructure.

Procedure

1. Open the **Microsoft Azure Portal** and sign in with your Azure account.
2. Create or select a **Resource Group** in which the required Azure resources will be deployed.
3. Open **App Services** from the Azure Portal and select **Create** → **Web App** to demonstrate the PaaS environment.
4. Enter the required application name, select the subscription and Resource Group, and choose a suitable deployment region.
5. Select **Code** as the deployment option and choose **Linux** or **Windows** as the operating system according to the requirement.
6. Select an appropriate runtime stack and create or select an **App Service Plan** with the required compute resources.
7. Review the configuration and click **Create**. Azure automatically provisions the required platform environment.
8. After deployment, open the **App Service Overview** page and select the application URL to verify that the application is running.
9. Configure application settings, environment variables, scaling options, and other required platform settings through the Azure Portal.
10. Verify the deployed application and take screenshots of the **App Service configuration, deployment page, and running application**.

IMPLEMENTATION:

Result:

The PaaS environment was successfully created and configured using Microsoft Azure App Service. The application was deployed and accessed through the Azure-provided web URL without requiring direct management of the underlying servers, demonstrating the basic concept of Platform as a Service.
